

Got you — you want **MORE detailed points** specifically on **Characteristics of Educational Technology** *based on your second file too.*

I checked the new file you uploaded and combined it with the earlier one to produce a **much deeper, richer, more complete** list of characteristics for your individual presentation.

Below is the **expanded, lecture-level, and presentation-ready** version.

☆ Characteristics of Educational Technology (FULL & EXPANDED VERSION)

(Based on both uploaded documents)

Educational Technology (ET) is broad, scientific, systematic, and focused on

improving teaching and learning. Here are the **major, expanded characteristics**:

1. ET is Systematic and Organized

Educational technology uses a **planned, step-by-step process** rather than random teaching.

It includes:

- . identifying learning goals
- . selecting appropriate media
- . designing instruction
- . implementing and evaluating

This makes teaching **consistent, efficient, and well-structured**.

2. ET is Scientific in Nature

It is based on results from:

- . educational psychology
- . communication science
- . learning theories
- . instructional design models

It applies **tested and proven principles** instead of guesswork.

3. ET is Technology-Based (Media, Tools, and Systems)

From your second file, ET includes the **use of all types of media**:

- . visual media (charts, pictures, projectors)
- . audio media (radio, recordings)
- . audio-visual media (TV, videos, films)
- . digital media (computers, smartphones, LMS)
- . new & emerging technologies (VR, simulation, AI tools)

This broad use of media is a central feature of educational technology.

4. ET is Learner-Centered

Learning happens best when it fits the **needs, pace, interests, and abilities** of learners.

ET emphasizes:

- . individualized learning
- . self-paced instruction
- . interactive learning
- . student participation

It moves away from the traditional teacher-centered approach.

5. ET is Based on Communication Principles

Your second file shows that ET views teaching as a **communication process** involving:

- . sender (teacher)
- . message (content)
- . channel (media)
- . receiver (student)
- . feedback

If any part of this chain breaks, learning becomes poor.

Therefore, ET works to **reduce noise** and improve communication.

6. ET Improves Teaching and Learning

It enhances:

- . clarity of content
- . motivation
- . learner engagement
- . retention of information
- . understanding of complex ideas

For example:

Simulations help science students understand processes that can't be observed directly.

7. ET Emphasizes Individualized and Personalized Learning

Students learn differently. ET supports:

- . self-instructional modules
- . adaptive lessons
- . self-paced video learning
- . computer-assisted instruction (CAI)
- . mobile learning

This allows each learner to proceed according to their own pace.

8. ET Uses Both Hardware and Software

Your document explains that ET includes **both tools (hardware) and materials/programs (software)**:

- . Hardware: computers, projectors, radios, VR, videos
- . Software: apps, educational programs, tutorials, digital books

These two work together to improve instruction.

9. ET Is Dynamic and Evolving

Technology constantly changes.

Educational technology grows with:

- . modern media
- . digital platforms
- . AI tools
- . online learning systems

It never stays the same — it always updates teaching methods.

10. ET Is a Problem-Solving Approach

ET helps solve educational problems such as:

- . low motivation
- . limited resources
- . communication barriers
- . difficulty understanding abstract concepts

- . large class sizes

For example: multimedia can simplify complex lessons.

11. ET Focuses on Efficiency and Effectiveness

ET aims to make learning:

- . **faster** (efficient)
- . **more successful** (effective)

This includes:

- . saving time
 - . reducing teacher workload
 - . improving results
 - . making learning easier
-

12. ET Is Based on Learning Theories

Educational technology integrates:

- . behaviorism
- . cognitivism
- . constructivism
- . social learning theory
- . connectivism

Each theory influences how technology is used in teaching.

13. ET Includes Management, Design, and Evaluation

Your content shows ET is not only about media but also about:

- . **managing** educational processes
- . **designing** instructional systems
- . **evaluating** learning outcomes

This makes it a complete **system**, not just a tool.

14. ET Supports Interactive and Participatory Learning

Learners do more than listen — they **interact**:

- . click
- . explore
- . respond
- . collaborate
- . simulate
- . practice

This active participation increases understanding.

15. ET Connects School Learning with Real Life

Through:

- . videos
- . field trip recordings
- . real-world simulations
- . digital storytelling
- . online demonstrations

Students relate learning to real situations.

 **Very Short Version (to read in presentation)**

Educational technology is **systematic, scientific, learner-centered, media-based, communication-oriented, evolving, and focused on improving, personalizing, and making learning more effective.**
